

and thoroughly tested of the lot.

If you're a little more adventurous, you can get more frequent updates by using the Beta channel. The Dev and Canary channels are meant only for developers and are totally not meant for daily use.

Sandbox security separates each program into its own enclosure

Chrome OS vs Chromium OS

Chrome OS is a finished product whereas Chromium OS is its source code. Released a few months after the announcement of Chrome OS, Chromium enabled independent developers to create their own chrome browser-centric OS builds. You can think of Chromium to be the basic skeleton on which Google fleshed their user interface design, branding, media formats and a host of features. Chrome also enjoys Google's security and updates, and is managed completely by Google. Chromium, on the other hand, operates under what is called The Chromium Project. This is a community of Google's own developers and developers working with developers from outside the company working together. Pretty much any system can be made to run Chromium OS builds, but Chrom is restricted to manufacturing partners.

Chromium OS follows a three-tiered architecture. First is the Chromium based browser and the associated UI. This is the part which involves user interactions with the OS. Then comes the system level and user-land software,

One is a consumer OS, other is its source code
