

from your laptop or phone wirelessly. But even with compelling reasons like these, Chromecast still isn't the best streaming stick out there.

Why don't people buy Chromecasts?

Even though BooMan has waxed eloquent on this topic just a couple of months ago,

A little too cramped

we will repeat it here (in less flowery language). The Chromecast, while an excellent device in theory, falls short in reality. The connection to it is unusually unstable even when the Wi-Fi network is strong enough, the Chromecast Audio is way too overpriced for what it does. Same for the Chromecast Ultra – even though 4K TVs are proliferating the market, there just isn't enough 4K content out there to make the Chromecast Ultra truly worthwhile. And uncharacteristically from a Google product, all the Chromecasts suffer from frequent overheating and the fit and finish on them is not exactly premium.

You must also consider that the Chromecasts have strong competition in the form of Roku and Amazon Fire Sticks (Fun fact: Amazon banned the sales of both the Chromecast and Roku on it's site to try and eliminate competition). The Roku in particular, absolutely trounces the Chromecast in pretty much every way, be it from the Kodi support or the included remote (Chromecast is notorious for having terrible UI)

But still, Google was one of the pioneers of the streaming stick business and they've had a couple of years to work on their game. Perhaps their next product will be enough to wow everyone and get them to switch back. **d**
