

It's important to note that Daydream in itself is not a headset, but a platform. The intended purpose is for other manufacturers to make use of Daydream. While Google has made its own VR headset, Daydream also provides a hardware standard for other manufacturers to follow when making their own headsets. They will also have access to a hub of VR software sourced directly from Google.

The goal is to unite the currently fragmented VR market and provide a single place – Play Store and everything – for Android devices to enjoy VR from. This includes VR-ready apps, videos and more, which can be easily distributed using the platform.

• Daydream View

The Daydream View is Google's VR headset. It functions like just about any smartphone VR headset in the market – you open the flap on the front, insert your smartphone into it, secure the flap over your phone, wear the headset and enjoy your VR experience. On release, the Daydream View

was only compatible with the Pixel, but has expanded to a select few smartphones. You can see the list of compatible smartphones here: <http://digit.in/ddrphones>

The Daydream View structurally looks like a regular VR headset but there are a few differences. The surface material used looks and feels

like fabric. The design of the headset, i.e., the strap placement is intended to avoid the headset from getting too heavy on your nose. It's also designed to be wearable while wearing glasses.

Google is in talks with HTC to create a stand alone VR headset, the high-end sort that you don't need a phone for. But that's coming soon.

• Daydream Controller

Google also offers a controller along with the Daydream View. While they
