

You can start drawing right away – in the air, on the ground, wherever you please, in whatever direction, and at whatever angle you want (if you’ve got the room for it, that is). Your canvas is as big as your headset’s play area.

There’s a large selection of brush types and drawing tools available and of course, plenty of colours to choose from. We did say it was like MS Paint. The Tilt Brush is currently available for both the HTC Vive and the Oculus Rift, and one look at its reviews on [Steam\(link\)](#) will tell you that people really enjoying drawing stuff in VR.

Earth VR

You might most probably already be familiar with Google Earth. If not, don’t worry, we go more in-depth into Google Earth and Google’s other geo-services in part two of this Fasttrack next month. For now we focus on Earth VR.

To give you a general idea, Google Earth uses satellite imagery, aerial photography and GIS (Geographic Information System) data to provide you with a very accurate and 3D-like map of the world. This made exploring the world via map a much more interesting activity.

Now, we’re guessing you can imagine what Earth VR does. Earth VR attempts to take this to the next level, from just looking at accurate representations of the world, to actually being there.

Earth VR is still a work in progress and they recently implemented Street View into Earth VR which contains imagery from 85 countries as of right now.

Like Tilt Brush, Earth VR is available for both the HTC Vive and the Oculus Rift.

Cardboard

Prior to Daydream, Google Cardboard was Google’s VR platform. This was intended to be a fully open source platform that was available to everyone; which is what they’re going for with the Daydream now.
