

Now coming to the headset, Cardboard is... well, cardboard. One of its appeals lies in the fact that it is cheap. You have the option to upgrade it as you see fit or according to your budget. You can opt for better material, get a strap, maybe get a controller (or two). In the end it could go from being dirt cheap to as pricey as some of the VR headsets in the market today.

Don't expect every VR experience to be good with the Cardboard, at best it's meant for entry level VR entertainment. If you get yourself a Cardboard and enjoy it, then you can consider opting for a higher-end VR headset.

Cardboard SDKs are openly available for those who want to create their own VR content for the Cardboard. These include Unity, Unreal Engine 4, and the Android SDK which support both Daydream and Cardboard, and the iOS SDK which currently supports only Cardboard.

Google AR

Tango

Now we're heading into Google's Augmented Reality projects, and first up is project Tango, or just Tango.

Tango is designed in a way such that it's specific to certain phones or devices. Not everything can be Tango-ready.
