

There are two Jump Camera rigs you can choose from right now, the YI HALO and the GoPro Odyssey.

Google Glass

Google Glass was an optical HMD which was designed to look like a pair of glasses and was originally being developed by Google X (now X).

Glass displayed information on its screen in a hands-free format and enabled users to communicate with it via voice commands.

After about a year or so of selling a prototype in what was called the “Google Glass Explorer” program, Google made Glass available to the public in 2014. However, it received a lot of criticism due to privacy and safety concerns. The device launched with a camera attached and one couldn’t tell if one was being recorded, was one among the chief concerns. This prompted Google to discontinue Google Glass early in 2015. However, Google recently announced the Google Glass Enterprise Edition, which would not release for the general public. **d**
