

a slanted top, that indicate its state of working. The device is made of white plastic with a modular base, which allows people to swap the colours and materials to suit the existing home décor. As of the writing, Google only offers six variants, three colours of fabric material and three of metal.

Hardware

As from the previous section, it's clear that Home is designed to blend in your house rather than stand out like a life-size statue of a centaur. The white plastic can go with almost any interior and the choice of a base lets you deepen your home décor. Three of the six options are available in fabric, with these colors – Mango (Orange, ironically), Marine (Turquoise) and Violet (more like a Purple). The remaining half are made of metal – Carbon (Black), Copper (Google couldn't come up with a cool name for this) and Snow (very light Grey). If the white plastic look doesn't work, you can also raise the swank by applying a skin over the upper part. These skins are only available through third party sellers.

On the slanted top of Home is a ring of LED lights and a capacitive touch panel. The LED lights display the working status of the device and the volume level. Touch panel can be used to control playback - play, pause and volume. But who are we kidding, it's best to use the device like Tony Stark does. Apart from the touch panel, the device also comes with a mute button. This keeps Home from listening to you all the time.

Inside this little jar is an array of speakers which push out sound all around and also microphones that have a farther reach than the ones in your phone. As for the processing prowess, it's actually same as the second-generation Chromecast. Same ARM processor and the Wi-Fi chip.

The six additional bases with incredible names.
