

Three, and provides the trifecta of phone services – texting, phone calls and mobile data – using those. What’s even better is that the usage isn’t limited to cellular networks either – Project Fi can also work flawlessly with Wi-Fi. Project Fi was first launched on April 22nd, 2015, albeit only for the Nexus 6. And that too, it was an invite based system. This was sensible considering the nascency of the project but it was sure agonising for people who did own a Nexus 6 but couldn’t get onto the project (Project Fi also hoped to boost the flagging sales of the Nexus phablet but again, the invite system was a huge turn off). The archaic system was finally dropped in March, 2016

Project Fi

An unassuming logo for the greatest network ever?

and the device lineup gradually grew year by year. Right now, Project Fi supports 8 phones, and 8 phones only – the Nexus 6, the Nexus 5X, the Nexus 6P, the Pixel and the Pixel XL, the Android One Moto X4, and most recently, the Pixel 2 and the Pixel 2 XL.

Project Fi promises great coverage throughout the country. Since it uses bands from about four different network operators, chances are high that no matter where you are, you get a signal from at least one of them, providing almost no connectivity black spots, a feat no other operator can easily claim. With these companies existing globally, you also get roaming access in 135+ countries around the world! And the fact that it works via

Wi-Fi too is also not something to be ignored. Project Fi automatically and seamlessly connects to select Wi-Fi hotspots, with data encryption through an automatic VPN, so that you don’t have to fuss about finding the right SSID and Password combinations. Switch overs from WiFi to cellular and vice versa also happen without a hiccup, ensuring no break in calls or data services, leaving you with perhaps the best all rounded network in the entire world. And by all accounts, the customer service for Fi is also top notch – resolutions are speedy and issues almost never crop up. Sounds amazing right? It would be, but right now, it’s more bittersweet. Having such a tightly controlled device list means that a large demographic of users who would perhaps love the service just can’t use it without changing their
