

that integrates perfectly within the Google ecosystem. You can schedule appointments and events for any day at any time and set periodic reminders automatically, contact birthdays/anniversaries are automatically added as entries for every year, it trawls information from your email to add entries about flights, concerts and other events that you might have (this is a bit spooky to be honest). It is also integrated with Google Assistant so that you merely need to talk about an entry prefaced with an “Ok, Google” and it gets added to your log. Pretty nifty huh? You can access it on the dedicated apps and on the web – speaking of which, the web interface got a massive and beautiful overhaul last month. If time and event tracking is something of a sore point for you, there’s no better time to start using it than now!

Keep

Google Keep is a digital note taking service, similar to Evernote. But ‘note taking service’ is a bit of an understated catch-all phrase when in reality, Keep can do so much more. You can record voice notes, snap a picture and annotate it, or extract the text from the photo via inbuilt Optical Character Recognition, make to do and other types of lists and so much more. You can also organize your notes based on subject and colour code them and even have reminders built into them (with the help of Google Assistant) and most importantly, it’s all automatically backed up to the cloud so that you can access it from anywhere. It was released in 2013 and soon became a hit due to its tidier interface and better usage experience than competitors like

Microsoft’s One Note. While it does draw some flak for missing out on stuff like organisational support for longer text based notes, it is still a very capable and useful app that can streamline your productivity.
