

fuelled multilingual typing prediction as well as even more support to send media like gifs in chat. It was released in late 2016 and was pushed via Over The Air updates to most Android phones running Android 5.0 Lollipop and above. The multilingual support is just for western languages unfortunately. To cater to the Indian market, Google released the Indic Keyboard which has support for the scripts of 11 Indian languages (Assamese, Bengali, Gujarati, Hindi, Kannada, Malayalam, Marathi, Odia, Punjabi, Tamil, Telugu in case you were wondering). What's more, it even supports Hinglish! You can either use transliteration where you type in the phonetic word in English and it gets translated or use a native keyboard for your desired language. Hindi users can take it up a notch and use handwriting input although that's usually much more of a hassle.
