

even further. With the features it boasts, it could be the first step towards eliminating the 9 to 5 workday, or actually physically coming to work. Instead, a user could stay at home and provide as much clarity in their thoughts and actions through the features of Google Docs. And so, we come to the features.

Perhaps the biggest of these features is the editing option. Documents can be shared with multiple users, opened at any given time or place, and edited by multiple users simultaneously. If a user hasn't been given editing access, they can view the changes happening in real-time. These changes are simultaneously saved into the Google servers, and users can look at any or all of the past edits.

In 2016, Google also announced 'Explore', which is their way of adding functionality through machine learning. In Google Docs, Explore shows Google search results that pertain to the highlighted words in the document. In Sheets, Explore can be asked questions about the calculations on the worksheet, and will return the answer without any requirement of the formula. In Slides, there is a recommendation facility based on the content. All these seem like minor changes, but so did Google Drive.

Apart from these features, Google has also introduced an ability for users to comment in such a way that writing "Tell Kshitij to finish Section 4" will lead to Google notifying Kshitij about the pending work. This suite is improving with time as the basic editing features are being amped up so as to be able to compete with the Goliath that is Microsoft Office. Users can also view and edit files offline, as long as they are using Google Chrome.
