

But the real reason why Google's suite of tools is gaining increased success seems to be how mobile it is. Users can check on their documents whenever they want, as long as they have access to the internet. Drive allows an unlimited storage for Google Docs, Slides, and Sheets, so it isn't like space is running out. If, at a further date, the real-time abilities of this suite grow sophisticated enough for users to communicate at a level that allows for a digital office-like functioning, it will have reached its true goal. Knowing Google, you can't write such a scenario off.

FIGHT : Google Drive vs the others

When it comes to personal storage and application, the three biggest competitors are OneDrive, Dropbox, and Google Drive. All three of these services have millions of users, and for good reason. They all have their specific advantages based on what kind of users they target. The simplest way to get started on the comparison between the three is to consider the types of storage options they provide. Dropbox provides 2GB of free storage, while OneDrive gives 5GB, and Google Drive gives 15GB. As for flexibility in further plans, Google Drive trumps the other two as it has more subscription plans ranging from 100GB to 30TB.

The second way is to compare their sync speeds and characteristics. Dropbox uses their patented block-level copying mechanism wherein, once uploaded, it syncs only the part of the file that has been changed, thus making the process much faster. Google Drive allows users to sync devices running Windows, Mac, iOS, and Android. Oddly enough, Linux isn't a featured option. Odder still is the fact that Google Drive doesn't support block-level file copying. It does, however, support selective sync.

Google Drive offers more flexibility and a cheaper alternative than almost all its competitors.
