

When it comes to file sharing, Google Drive allows users to share content based both out of files and folders, either through email or through a generated link. Users can grant permissions to both view and edit the shared data, as well as make comments. It still has some flaws though – there is still no password protection for links, no way to set an expiry date for the links, and no way to actually view the number of people with whom the link has been shared with without manually checking for the link icon besides the content name.

Perhaps an issue that none of these three cloud storage giants have been able to address is the security of the data they store. For one, OneDrive doesn't provide any encryption for at-rest data, meaning that only the data

Data theft is something everyone is afraid of. There was a time when such concerns belonged to the upper echelons of society who were constantly hounded by paparazzi. That has changed completely.

that is being actively used is encrypted. This makes for shoddy protection of private files. Even though Dropbox and Google Drive provide more protection, they've both had their fair share of hacks – Dropbox in 2012, where 68 million usernames and passwords were stolen, and Google Drive in 2016, where almost 13,000 new accounts were being hit by a Trojan horse every day.

Google Drive : The Future

It hasn't all been controversy though. Hacks like these only happen rarely, and these corporations keep upgrading their security to combat the latest digital threats they face. Like with everything new, it is susceptible to a brief period of failure, but it is an acceptable risk. Especially if the advantage of
