

Auto-backup, sync:

Using Google Photos as your primary photo storage is as easy as installing the app on your smartphone and following the on-screen instructions. Auto-backup helps free storage space on your phone and avoids keeping duplicate copies as well. One detail that you shouldn't miss while setting up Photos is selecting the quality level for uploads. Although Google Photos is free, it's only free if you set it to store compressed 'High-Quality' pictures instead of storing them in their original quality. What this means is photos larger than 16 megapixels, and videos with resolution higher than 1080p will automatically be downsized. While selecting the 'Original Quality' level will allow you to upload RAW and original unaltered version of your pictures, doing so will eat into the common storage pool (15GB) shared by all your Google services like Gmail and Google Drive. This is why the 'high-quality' level selection is recommended and it works efficiently for most of your regular photo storage needs. However, if required paid premium plans are available like: 100GB of storage for ₹130 per month or to 1TB of storage for ₹650 per month and more. Once Photos is up and running, it will display your on device photos and videos by organising them in reverse chronological order. We recommend selecting the 'Albums' option that will bring up a new organised view with your media separated into categories like 'People, Places, Videos, Animations and Collages'. Tapping onto the People category for instance will display a grid with portraits of faces appearing in your media. Going into each portrait will display pictures of the same person at one place and allow you to assign a name to that person.

Photo search, Face-recognition, Tagging, filtering and sharing:

If you have assigned names for people inside Photos, it becomes easy to search for all the pictures where that person appears in. If you haven't, you can still search by clicking the face of that person. Other ways of searching include: name of the place where the picture was taken, when was it taken, name of things that you remember seeing inside the picture, colours, and more. Image-search inside Photos is really efficient at finding exactly what you want and listing it out for you. Knackered thinking about how to get rid of all your photos from your previous relationship out of Google Photos? We've all been there! Well, Photos provides a solution where you can select and filter people from a list of faces that shows all the people that commonly appear in your pictures. It's facial-
