

accounted for 6 percent of Google's overall sales, it contributed nothing towards its earnings.

The main problem with its users is that they watch most of the videos as embeds on other websites instead of visiting YouTube.com to watch them. Recently, YouTube has signed deals with organisations such as the NFL and The Daily Show to exclusively host their content, so as to widen their core demographic.

The WSJ wrote, "Google executives want [users] to turn on YouTube the way they turn on television, as a habit, where they can expect to find different 'channels' of entertainment." To do so, YouTube restructured its home page to be something more than just a repository of previously watched videos. It is now a dynamic webpage, reflecting current trends and user history to create a blend of up-to-date, targeted content.

Another thing YouTube is taking seriously is the latest Virtual Reality trend. Google announced recently that it is building a dedicated VR platform for Android phones called Daydream. Meanwhile, YouTube is teaming up with some of their best content generators to install 360 degree cameras so as to produce immersive VR content, and is already thinking of how to monetise this in the future. Like Daydream, YouTube experimented with videos that go beyond a video narrative when Google bought Spotlight Stories. They plan to create an interactive VR video experience for their users, and push the boundaries of immersive storytelling. Rumors connecting YouTube VR and Oculus Rift have also emerged.

Google Jump - the VR division - is collaborating with GoPro and their massive VR rig to create VR content for YouTube.
