

latest and greatest Android release is designed by Google, all together to give you (theoretically) the best Android smartphone experience ever.

The Google Pixel and the Google Pixel XL were first announced on October 4th, 2016 and shipped two weeks later. The phones were initially received well by the public, particularly due to the justified hyping of its camera. Google made much ado about the 'best camera EVER' and touted the DxOMark score of 89 (a feat that was never achieved before) and the phones did not disappoint - the shooters bundled were absolutely top drawer. This was even more remarkable, considering that this was Google's first attempt at a phone. The Pixels were also very handsome as well. An all aluminium chassis with glass accents on the back and the new Google 'G' logo made for a very clean, minimalistic back while the front looked a bit like an iPhone, with the screen dominating most of it with thick, chunky bezels on top and bottom. The chamfered edges along the sides made for very wieldy phones. The smaller Pixel in particular, felt really good and ergonomic in the hand. The Pixels were available in 3 colors - Quite Black, Very Silver and Really Blue. The AMOLED 5 inch FHD screens on the Pixel with 441 ppi and the 5.5 inch QHD (2560x1440) screens on

This was one seriously good camera

the Pixel XL with 534 ppi were both great in their own rights, but at the same time, they were a letdown. A FHD screen on a flagship costing so much isn't that great a deal. Added to the fact that the screens were a bit dull made the experience a little more bitter. But it was pretty color accurate so there isn't too much wrong with it. Apart from the stunning camera, the Pixel also boasted one of the best internals and cleanest Android user experiences (a lot of) money could buy. It was the first phone to have Google Assistant built in and also the first phone to ship with Android 7.1 Nougat. On the hardware side it boasted a Qualcomm Snapdragon 821 SoC with a quad core Kryo CPU coupled with 4 gigs of LPDDR4 RAM. Along with an Adreno 530 GPU, the Pixel had oodles of power, more than enough to drive practically anything and everything off your phone. The little skimpy 2,770 and 3,450 mAh batteries still got pretty decent battery life, and with the implementation of USB C Power Delivery (even though the SD821 supports QuickCharge 3.0), the Pixels charged REALLY fast. No wireless charging,
