

drive all Android applications, each and every activity that is run is triggered by an Intent.

- **Service** - A Service is a component of the Android system that is used to perform long-running operations in the background. Services do not provide a UI to the user.
- **Manifest** - The Android manifest, or simply 'manifest' as it is more commonly called, is a single xml file that contains essential information about an application that needs to be communicated to the Android system, before it can run any of the app's code.
- **Content Providers** - Content providers are a way of accessing data stored by the application itself, or by other apps, as well as sharing data. They secure data and provide access to it as a centralized repository. Most importantly you can configure it to allow other applications to securely access and modify the app data without causing data corruption or exposing sensitive information.

Google Cloud

"The cloud services companies of all sizes...The cloud is for everyone. The cloud is a democracy."

The cloud has exploded, and perhaps we have Google to thank for that
