

Cloud storage allows single click backups of files, code and software with ease and security.

a unified location to store all of this at a cheap rate and can be scaled on demand without huge upfront costs.

Creating a Cloud Storage location on Google cloud is as easy as going to the cloud storage dashboard, and creating a new bucket (a storage unit for gCloud). Once the bucket is created, we can upload files and folders to it right from the dashboard, or alternatively use the APIs to do the same. Like compute, cloud storage only charges for the amount of storage being used and not the uptime / availability of the same.

TensorFlow

AI or Artificial Intelligence is a program that mimics the intellect of a human being in its approach to solve a real world problem. Until recently the realm of science fiction, it gained a lot of ground when a program passed the Turing test in 2014 for the first time. Since then AI has grown by leaps and bounds and is today applied to everything from researching criminal profiles to predicting crop cycles and weather. Arguably the most innovative of approaches to computing in recent times, AI promises to completely disrupt the way we write software.

Many companies are spending billions of dollars in research on AI including Amazon, Nvidia and Google. In fact, the machine intelligence
