

Virtual reality (VR) frequently uses headsets, sometimes in combination with specially designed spaces, to replicate a virtual or imaginary environment by generating realistic images, sounds and other sensations that simulate a user's physical presence in it. A person using virtual reality equipment is able to "look around" and "hear" the artificial world, and even in some cases move around in it and interact with virtual features or items.

Google has also recently dipped its toes into this world with two of its products: Cardboard and Daydream.

While Cardboard is a relatively low cost VR, requiring only the use of a smartphone and a viewer (with or without lens), Daydream offers a richer and fuller experience. Google provides exclusive SDKs for development on

VR is only beginning to reveal its true potential.

VR and also supports using the hugely popular Unreal Engine and Unity Engine to power its apps.

Curiously enough, the SDKs are not limited to only the Android OS, but also support Apple's iOS. This clearly shows that Google is trying to establish a global platform for developing VR applications in an easy and consistent manner. Apart from providing the SDKs, Google has also established detailed guidelines - both for the apps as well as hardware - for
