

At the moment Android does not have an exclusive SDK for Android Things and instead the dependencies must be explicitly mentioned as part of the build from the Things support library. Checkout <http://digit.in/GoogleIoT> for more information about this.

As you can see, with the vast Google ecosystem that almost all of us have experienced (and some of us heavily depend upon) out there, an equally vast developer ecosystem has been created over the years by the software giant. With opportunities for developers to work on anything from AI to IoT to your friendly neighbourhood smartphone (and ample documentation and freely available resources to back all of that) it is abundantly clear why the Google ecosystem has so much to offer, to the end user as well as the developers. **d**

The Android Wear on your smartwatch can probably soon communicate with Android Things on your washing machine
