

Google's proprietary Tensor Processing Unit board

at the strategy board game 'Go'. This is an impressive feat that makes us wonder what's next in store for AI as a whole.

The idea of cloud computing is nothing new. In fact, we've been using cloud storage and cloud-based Software-as-a-service for free from Google for a while now. But as of late, due to the immense computing power readily available over the cloud, machine learning has received a huge boost. Machine learning, in this context, represents the type of computing that allows a computer to learn a particular behaviour based on immense sets of data. Thanks to the progress of cloud technology and the similar simplification of machine learning, companies like Google are leveraging and helping others leverage both to break technological bounds like never before

G Suite

On the Google ecosystem, almost all of us have heard of (and probably used) Google Docs and Google Drive. While these two are for the end-user, Google's offerings for the workplace are currently represented under the title of G Suite. Formerly known as Google Apps for Work or Google Apps for Your Domain, G Suite offers cloud computing, productivity and collaboration tools, software and products developed by Google since August 28, 2006.
