

ways. In this chapter, we will examine all aspects related to blogging. The first decision you must arrive at is deciding which blogging platform to use. You can use a hosted content management system such as Wordpress or you can sign up with a service like Blogger. The latter is relatively simple so we'll look at the slightly more challenging option.

Decide how you want to host your blog right now

WordPress Installation

If you purchase Linux hosting, you will be able to install WordPress from within the CPanel control panel. Alternatively, you can also install WordPress manually by downloading the required files by navigating to wordpress.org. In Linux, you have several options such as Drupal, Joomla and others. When compared to WordPress, the learning curve involved with the other content management systems is steeper.

To quickly install WordPress, you need to login to the CPanel and navigate to Softaculous module. You should select WordPress and provide the required information on the displayed screen. The 'In Directory' name should be removed if you want to install on the root directory. You need to provide name, description, username, password and click on the Install button. The database will be automatically created and you will view a success message with relevant URLs after the completion.

In addition to the main site, it is also possible to install WordPress on separate subdomains. For example, you can create several subdomains
