

1. AWS EC2 Dashboard
2. AWS CLI
3. AWS SDK

The most commonly used way to launch an EC2 instance is using the AWS EC2 dashboard and this is what we are going to learn.

Once you sign in to the AWS Management Console, go to the EC2 dashboard and click on Launch Instance to launch a new EC2 instance. Launching an instance consists of multiple steps mentioned below.

Step 1 - Select an AMI for your EC2 instance:

AMI is an Amazon Machine Image, which basically consists information about the OS of your virtual machine and the default software packages included in the machine. You may select any of the default AMI's available from the list.

Start off by picking AMIs which are pre-configured OS images in EC2.

Step 2 - Selecting an Instance Type:

Once you select the AMI, you will need to select the Instance Type. Instance type is the compute unit that you want to launch. It contains information like number of cores, memory, and I/O about the virtual machine. There are various instance types that are available in the list which you can select as per your needs. We will select t2.micro for now.

Step 3 - Configure Instance Details:

Once you have selected the instance type, you will see the Configure Instance screen where you can configure how many instances you want to launch, network configuration etc. At the moment, you just need to worry about
