

environment to make sure they work as expected before publishing your HITs in the Mechanical Turk marketplace. The sandbox provides a testing environment where you can publish and work on HITs to try them out before publishing them in the Amazon Mechanical Turk Marketplace. The sandbox consists of a Requester sandbox website and a Worker sandbox website.

You will need to create a Requester account on the Requester sandbox website, which is located at <https://requestersandbox.mturk.com>. You'll also need to create a Worker account on the Worker sandbox website located at <https://workersandbox.mturk.com> to view your sandbox created HITs as a Worker. There is no charge for using the Mechanical Turk sandbox sites.

Step 6: Set up an AWS SDK

The MTurk API can be accessed using the following AWS SDKs: Python/Boto (Boto3), Javascript (NodeJS or Browser), Java, .NET, Go, Ruby, PHP or C++.

Configure the AWS SDK to use the 'us-east-1' region. This is the region in which the MTurk API is available. Then connect to the MTurk Developer Sandbox and check your account balance (the Sandbox should always return a balance of \$10,000). To connect to the MTurk Developer Sandbox, set the API endpoint in your SDK to <https://mturk-requester-sandbox.us-east-1.amazonaws.com>.

Step 7: Prepay for Your HITs

Before you use the production version of Amazon Mechanical Turk you need to prepay for the HITs you create. Otherwise, you can't post your HITs to Workers. To post your HITs to Workers, you must have money in your Prepaid HIT Balance to prepay for all of your HITs. You can use a credit or debit card or debit card to prepay for the HITs.

Creating an HIT

The following procedure gives you an overview of creating, testing, publishing, and managing an HIT.

1. Define your HIT.

Construct your question in one of the Question and Answer Data Structure. The Question parameter accepts a XML string or HTML string.

2. Create HIT.

Build a new HIT with the CreateHIT operation or CreateHITwithHITType operation. Provide Title, Description, Keywords, and Question Details as outlined in the documentation.
