

Monitor EC2 and other AWS Resources

You can monitor EC2 instances automatically, without installing additional software with Amazon CloudWatch. It also automatically monitors Elastic Load Balancers for metrics such as request count and latency; Amazon EBS volumes for metrics such as read/write latency; Amazon RDS DB instances for metrics such as freeable memory and available storage space; Amazon SQS queues for metrics such as number of messages sent and received; and Amazon SNS topics for metrics such as number of messages published and delivered.

Monitor Custom Metrics

What's better is that you can even submit Custom Metrics generated by your own applications (or by AWS resources not mentioned above) and have them monitored by Amazon CloudWatch. You can submit these metrics to Amazon CloudWatch via a simple API request.

Monitor and Store Logs

CloudWatch Logs lets you monitor and troubleshoot your systems and applications using your existing system, application, and custom log files. With CloudWatch Logs, you can monitor your logs, in near real-time, for specific phrases, values or patterns (metrics). For example, you could set an alarm on the number of errors that occur in your system logs or view graphs of web request latencies from your application logs.

Examine logs from different AWS services.
