

2. To transfer money faster than the traditional system. In fact, it would be transferred instantly or within a few minutes/seconds.
3. Making the costs of transferring cheaper than what the trusted middle party collects.

What blockchain aims to do

Blockchain works on the fundamental ideas of distributed, and open ledgers.

Whenever a new block is added to the blockchain, it is shared with each node on the peer-to-peer network and every node verifies the authenticity of the block. They then arrive at a consensus, post which each node would add this block to their blockchain. Since it is decentralized, we can say that

Differences between centralised and decentralised systems
