

process than working directly with blockchains. Hyperledger provides open source ledger frameworks and educates people about DLTs. Parity is a client that allows interacting with the Ethereum blockchain.

Vertical Solutions - These are the best examples of how far the idea of blockchains can be taken. Beyond a point where they've broken the fundamentals of the technology. The concept of DLT applies to such solutions. They aren't designed to be open services that allow anyone and provide complete transparency. Instead, they're built for specific industries, only to address the issues of that industry. Often times they end up centralizing the system to cooperate with regulations and privacy requirements. Corda, as mentioned earlier, is part of such a system.

APIs and Overlays - The aim of this approach is to introduce decentralization into existing app ecosystems. These are apps and consumer services that utilize the DLT system to make the operations faster and reduce costs. Harmony APIs, by Fathom, allow management of sensitive documents while integrating with existing software ecosystems. Tierion is used to check the integrity and timestamps of data and files associated with a blockchain.
