

Everybody has their preferences of using a particular browser, OS etc. Make sure that your website is compatible across platforms

are they will not hang around to browse any further. The biggest turn-off for a customer on an ecommerce site is finding outdated product information. Picture this - a customer clicks on a link with a product image and description, finds the price agreeable and goes ahead to make the payment only to realise the link is broken or outdated. This could mean instant death of the sale (unless the customer really has their heart set on the product. How often does that happen?)

The most basic difference between a static website and a dynamic one is that people have more incentive to visit the latter. Keep the content on your site fresh. Display a different set of products from time to time so that repeating customers have something to look forward to. And hesitant browsers (people, not programs) find something new every time they visit. This could entice them to shop the next time around. When people know a product isn't going to be on display forever, they are more likely to pick it up when it is.

Another fringe benefit of constant updates is the win win situation it creates for your website on search engine systems. The most recently updated websites with the correct set of keywords is more likely to show up higher in search results. And this is primarily where most of your new traffic is going to come from. So it is an avenue you definitely want to focus on.
