

A route is like a signpost for requests telling them where to go for the appropriate action to take place

browser you will see the access `Route::get('/user', 'UserController@index')`.

Routes defined in the `routes/api.php` file are nested within a route group by the `RouteServiceProvider`. The prefix and other route group options by modifying this class.

The router allows you to register routes that respond to any HTTP verb:

```
Route::get($uri, $callback);
Route::post($uri, $callback);
Route::put($uri, $callback);
Route::patch($uri, $callback);
Route::delete($uri, $callback);
Route::options($uri, $callback);
```

You also have the added functionality to register a route that responds to several routes using `match` or all of the route functions using `any`.
