

This is created by adding the following lines

```
<form method="POST" action="/profile">
    @csrf
    ...
</form>
```

The `VerifyCsrfToken` middleware, which is included in the web middleware group, will automatically verify that the token in the request input matches the token stored in the session.

There are some interactions which you will have to exclude from CSRF tokens like payment gateways. When a gateway like Citrus or CCAvenue or Stripe interacts with your application, they will not know what CSRF token to send to your routes. You can exclude the routes by adding their URIs to the `$except` property of the `VerifyCsrfToken` middleware:

```
<?php
namespace App\Http\Middleware;
use Illuminate\Foundation\Http\Middleware\VerifyCsrfToken as Middleware;

class VerifyCsrfToken extends Middleware
{
    /** The URIs that should be excluded from CSRF verification.
     * @var array
     */
    protected $except = [
        'stripe/*',
        'http://example.com/foo/bar',
        'http://example.com/foo/*',
    ];
}
```

Controllers

Controller is the third pillar of the MVC framework of Laravel. As explained earlier, it directs the traffic between the views and the models. To create a controller type in Artisan

```
php artisan make:controller <controller-name>
```

All controllers are by default stored at `app/Http/Controllers`. There is some basic coding done for you and you can add in your own lines to it. Take note of the naming convention for controllers. Since the `RouteServiceProvider` loads your route files within a route group that contains the namespace, specify the portion of the class name that comes after the `App\Http/Controllers` portion of the namespace. E.g. if you wish to create a controller within
