

ACTIONS HANDLED BY RESOURCE CONTROLLER

Verb	URI	Action	Route Name
GET	/photos	index	photos.index
GET	/photos/create	create	photos.create
POST	/photos	store	photos.store
GET	/photos/{photo}	show	photos.show
GET	/photos/{photo}/edit	edit	photos.edit
PUT/PATCH	/photos/{photo}	update	photos.update
DELETE	/photos/{photo}	destroy	photos.destroy

framework will automatically convert the string into a full HTTP response:

```
Route::get('/', function () {
    return 'Hello World';});
```

Typically, the response won't be a simple string but a view or user presentation. This can contain headers and text.

```
Route::get('home', function () {
    return response('Hello World', 200)
        ->header('Content-Type', 'text/plain');});
```

You can also attach a series of headers to the response

```
return response($content)
    ->header('Content-Type', $type)
    ->header('X-Header-One', 'Header Value')
    ->header('X-Header-Two', 'Header Value');
```

Sometimes, instead of a response, you may want to redirect the user to another URL. The simplest method is to use the global redirect helper:

```
Route::get('dashboard', function () {
    return redirect('home/dashboard');});
```

Sometimes you may wish to redirect the user to their previous location, such as when a submitted form is invalid. You may do so by using the global back helper function. Since this feature utilizes the session, make sure the route calling the back function is using the web middleware group or has all of the session middleware applied:

```
Route::post('user/profile', function () {
    // Validate the request...
    return back()->withInput();});
```

These are just some of the responses you can send to the user. Laravel is very flexible in this particular aspect. **d**
