

```

    messages.php
/es
    messages.php

```

There may be a translation-based application that have a heavy translation requirements. In that case, defining every string with a shortcut will become very confusing for the user. To solve this problem, Laravel has a 'default' translation definition of strings which can be used as the key. These kind of translation keys are stored in the 'resources/lang directory. For instance, if the application has a German translation, the following 'resources/lang/es.json' file should be created:

```

{
    "I have a computer.": "Ich habe computer."
}

```

We can use the same logic to create the basic logic behind making plural of a sentence. This can be used in Pluralisation problems which would otherwise be very complex to solve. By creating a 'pipe' character, singular and plural versions of a sentence may be visualised:

'apples' => 'There is one apple | There are many apples',

After defining the basic translation string, we can use the 'trans_choice' function to get the 'count' for the line and use the logic that if the count is greater than one, then plural version of the sentence is to be used. This is just a small example of how we can use basic logic to solve seemingly simple problems.

JavaScript and CSS Scaffolding

Laravel can be used with any kind of JScript or CSS preprocessor as the user wants. However, it comes with a starting point in the form of 'Bootstrap' and 'Vue' which can both be easily installed as front-end packages. By using Laravel Mix, using CSS becomes an easy and seamless process. For JavaScript, Laravel provides with a basic scaffolding to make it easier using JavaScript without even using any kind of specific pre-processor. This is done using 'Vue'. With Vue, we can easily build robust JScript applications with the help of an expressive API. All the JScript components may be easily compiled into a single JavaScript file. Laravel also has an option to remove the scaffolding option if you prefer a more traditional approach and want to use your own pre-processor.
