

```

use Illuminate\Http\Request;
class ProfileController extends Controller
{
    /**
     * Update the user's profile.
     * @param Request $request
     * @return Response
     */
    public function update(Request $request)
    {
        // $request->user() returns an instance of the
        authenticated user...
    }
}

```

The screenshot shows a web form titled "User registration". At the top, there is a red error box containing the following messages: "The first name is required", "The last name is required", "The email is required", and "The password confirmation does not match". Below the error box, there is a section labeled "Required Fields" which contains five input fields: "First name", "Last name", "Email", "Password", and "Confirm Password". Each field has a small red error icon to its right. At the bottom right of the form, there is a blue "Submit" button.

Any registry form needs a validation procedure to make sure that the specified fields have been filled up in the correct manner

To determine if a user is already logged in, the 'check' method can be used in the auth facade. The system will return 'true' value if that is the case:
