

This image gives a basic idea how encryption works

```
try {
    $decrypted = decrypt($encryptedValue);
} catch (DecryptException $e) {
    //}
```

Hashing

The 'Hash' facade in Laravel provides Bcrypt and Argon2 hashing for storing user passwords. Hashing is the transformation of a string of characters into a shorter fixed-length value or key that represents the original string. The default hashing driver is configured and stored in the 'config/hashing.php' configuration file. There are two supported drivers, namely 'Bcrypt' and 'Argon2'. To hash a password, you can use the 'make' method on the 'Hash' facade:

```
<?php
namespace App\Http\Controllers;
use Illuminate\Http\Request;
use Illuminate\Support\Facades\Hash;
use App\Http\Controllers\Controller;
class UpdatePasswordController extends Controller
```
