

In `Form::open()`, we need to add `'files'=>'true'` as shown below. This facilitates the form to be uploaded in multiple parts.

```
Form::open(array('url' => '/'
uploadfile', 'files'=>'true'));
```

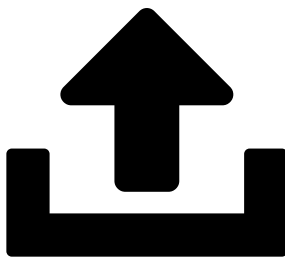

Ready to try it out yourself?

Step 1 - Let's start by creating a simple view file - `resources/views/uploadfile.php`. After creation, you can copy the below code in that file.

```
<html>
<body>
    <?php
        echo Form::open(array('url' => '/'
uploadfile', 'files'=>'true'));
```

```
        echo 'Select the file to upload.';
        echo Form::file('image');
        echo Form::submit('Upload File');
        echo Form::close();

    ?>
</body>
</html>
```

The ability to upload files is an important functionality and can't be missed out on. How else are you going to let your future employer know how awesome you are?

Step 2 - Once you've created the view file and inserted the code above, it is time to create something called a controller. A controller is an element that'll determine the flow of data. Type in the below line of code to create a new controller.

```
php artisan make:controller UploadFileController --plain
```

Step 3 - If you've managed to do steps 1 & 2 correctly, you should receive the following output - `"controller created successfully"`

Step 4 - Now that you've successfully created a controller, the main piece of code needs to be added to:

```
app/Http/Controllers/UploadFileController.php
```

(Refer: https://www.tutorialspoint.com/laravel/laravel_file_uploading.htm for code to be added.)
