

Step 5 – Add the following lines of code in app/[Http/routes.php](http://routes.php).

```
Route::get('/uploadfile', 'UploadFileController@index');
Route::post('/uploadfile', 'UploadFileController@showUpload-
File');
```

Step 6 – Now that you are all set with the right code, it is time to test it out on your browser. Type in <http://localhost:8000/uploadfile> in your browser's address bar. You'll now be redirected to the output page.

Step 7 –Voila! The image seen below is what the result will look like. Pretty cool, isn't it?

Packages & Validation in Laravel

Here are a few examples of some of the packages available for Laravel.

Laravel JS Validation

Validating every field of a form is a very tedious and time-consuming job with loads of space for error. Every time when we need to validate things, we rewrite the code. Laravel had fixed this problem for everyone by releasing a validation Package, which is naturally a top ten Laravel package, given the amount of workload it reduces.

Developers can validate forms automatically by referencing them to their predefined validations. The messages are loaded from our validations and translated according to your localization preferences. With JSvalidation, we can validate our forms using Javascript automatically. The main goal of this package is its ability to reuse our PHP validation logic to validate forms via Javascript. If we validate our forms using controller, the simplest way to reuse our validation rules is by sharing our rules between controller methods. By using FormRequest, you could configure your validations directly in the view.

Laravel Javascript Validation package helps us reuse our Laravel Validation Rules, Messages, FormRequest and Validators to validate forms automatically on the client side without re-writing any Javascript code or using HTML Builder Class.

Conclusion

In conclusion, after reading this article, a Laravel newbie would get a much better grasp on creating forms, exploring various packages that the language has to offer, understanding validation logic and the functionality to upload files. **d**
