

Sessions

Ever accepted cookies when you've visited a website? Looked up your browsing history when you cannot recollect what website you found something on? The unanimous answer would be yes. These are examples of what a session is. Sessions basically is data storage capability on a web server. They store information on a user's request that is made to the website. They are the bridge between the user's request and the request being validated. The stored data is not restricted to just a single web page. It applies to multiple pages. What happens when you accept cookies on a site? The host receives your cookies as a `$_GET` variable.

The finish point or the stop point of a session could be one of the following situations:

- The person looking at the sites closes their browser when done with surfing the web for information.
- Sometimes, we set timings on our browsers to store this information. When that timelines expires, the server itself automatically obliterates this information.
- In some instances, the browsing session is destroyed by the programmer.

What are the key uses of Laravel's session? Websites that have members logging in with a username and password have a good use for this. If you are a shopping website and use shopping carts, you will need to use sessions. These are just examples and it is important to remember session is needed to maintain continual function of the browsing and make this a good experience for the website user. Where are the files saved on the user's computer? They are all grouped and accessible in a temporary or specific folder. They are always stored under unique filename.

With even a limited amount of knowledge, cookies are not hard to decipher. It is quite easy for your website users to read the information stored in these cookies. Laravel's session protects the website from leaking important information or in other words provides data protection. The website user cannot read this material. Data saved in Laravel's session is a simple array. Basically, it is a collection of data structure consisting of values and variable. Sessions can be controlled by the `$_SESSION` superglobal. The globally agreed strong point of Laravel is its ease of use and time saving techniques. Laravel's sessions is known to be easier to use by web developers than using cookies. What are the main areas sessions can be used?
