

An easy schematic to understand how caching works in the virtual world

How do you configure Memcached?

Memcached can be installed by using the code `$ sudo apt-get install -y memcached php5-memcached`. This is followed by restarting apache by using the code `$ sudo service apache2 restart`. Finally, to configure memcached, use `Edit app/config/cache.php` and change the driver to 'memcached'.

Components of Sessions

Data Retrieval in Laravel Sessions

How does one access the data acquired by sessions? There are two main methods to do this. The first one is using the globally used session helper. This can be done via an HTTP request.

The second one is via a Request instance. This can be done via a type-hinted controlled method. A controlled method dependency is automati-
