

```
'mysql' => [
    'read' => [
        'host' => '192.168.1.1',
    ],
    'write' => [
        'host' => '196.168.1.2'
    ],
    'sticky'    => true,
    'driver'    => 'mysql',
    'database'  => 'datasample',
    'username'  => 'root',
    'password'  => '',
    'charset'   => 'utf8mb4',
    'collation' => 'utf8mb4_unicode_ci',
    'prefix'    => '',
],
```

The above code is case-sensitive and you should provide the details correctly. Even if you miss a comma, the system will return an error. It is also possible to use multiple database connections but it should be carried out via the connection method on the DB facade. However, the method should equate to any one of the connection names provided inside `config/database.php` file. The required code sample to enable multiple database connectivity looks like as shown below:

```
$users = DB::connection('foo')->select(...);
```

Running queries

Like in any other database, you are now ready to run queries using select, update, insert, delete, and statement via the DB facade. We have given the sample code to perform each query operation below. The complete code is mentioned on the official Laravel documentation page.

Select

```
$users = DB::select('select * from users where active = ?', [1]);
```

Insert

```
DB::insert('insert into users (id, name) values (?, ?)', [1, 'Martin']);
```
