

ability to use `where` and `orWhere` methods. With `union()` and `unionAll()` methods, you can merge the first query with the secondary query by passing the argument as a parameter.

Some of the other methods available with the query builder are `where`, `whereBetween`, `whereNotBetween`, `whereIn`, `whereNotIn`, `whereNull`, `whereNotNull`, `whereDate`, `whereMonth`, `whereDay`, `whereYear`, `whereTime`, `whereColumn`, `orWhere`, `whereExists`, `orderBy`, `latest`, `oldest`, `inRandomOrder`, `groupBy`, `having`, `skip`, `take`, `insert`, `insertGetId`, `update`, `increment`, `decrement`, `delete` and `sharedLock` methods.

Pagination

Pagination is a very difficult and complex process. In Laravel, the paginator is deeply integrated with the query builder and Eloquent ORM. Moreover, the HTML file generated by the paginator is completely compatible with the Bootstrap CSS framework. To generate paginated list of items, you need to just make use of the `paginate()` directly on the query builder and pass the number of items that should be displayed on the page as a parameter. The result will be displayed by taking into account the limit and offset of the active page. The `simplePaginate()` method can be used if you would like to display only the Next and Previous links, which enhances the performance. It is also possible to manually create a paginator by creating an instance of `Illuminate\Pagination\Paginator` or `Illuminate\Pagination\LengthAwarePaginator`. The `links` method can be used to display the links to the remaining pages in the generated result set. It is possible to customize the URI used by the paginator with the help of `withPath()` method. The `appends` method helps you to provide the query
