

Testing

Before you deploy your Laravel application, you need to put it through the works.

Testing is a crucial phase in any programming language and framework. The applications developed using a specific language should be tested using all possible scenarios to avoid runtime errors during the real-world usage. If you are familiar with Microsoft Visual Studio, you should know about the internal debugging tools, which will help you to test the active application for errors. In this chapter, we will examine the concepts and steps involved to test applications developed using the Laravel PHP framework.

Introduction

Laravel provides integrated support for testing with PHPUnit and the required file named `phpunit.xml` is being created during the installa-
