

junction with `assertStatus()` method, which accepts the HTTP code as the argument.

If you would like to test file uploads, you have to call the `Illuminate\Http\UploadedFile` class, which includes a fake method to generate dummy files or images for the purpose of testing. You should also mention `Illuminate\Support\Facades\Storage`, `Illuminate\Foundation\Testing\RefreshDatabase` and `Illuminate\Foundation\Testing\WithoutMiddleware` classes. Moreover, the code for testing file upload accepts `UploadedFile::fake()` method and the required image or file name should be specified as an argument.

The `fake()` method also accepts the height, width and size of the image as shown in the code listing below:

```
UploadedFile::fake()->image('image1.jpg', $width,
$height)->size(100);
```

It is also possible to create any type of files using the `create()` method. For example, if you need to create a PDF file, you have to mention the file name followed by an argument such as `$sizeInKilobytes`.

Laravel ships with a wide range of custom assertion methods to enable you to use them during PHPUnit testing phase. Some of the important methods are `assertCookie()`, `assertCookieExpired()`, `assertCookieMissing()`, `assertDontSee()`, `assertDontSeeText()`, `assertExactJson()`, `assertHeader()`, `assertHeaderMissing()`, `assertJson()`, `assertJsonFragment()`, `assertJsonMissing()`, `assertJsonMissingExact()`, `assertJsonStructure()`, `assertJsonValidationErrors()`, `assertPlainCookie()`, `assertRedirect()`, `assertSee()`, `assertSeeInOrder()`, `assertSeeText()`, `assertSeeTextInOrder()`, `assertSessionHas()`, `assertSessionHasAll()`, `assertSessionHasErrors()`, `assertSessionHasErrorsIn()`, `assertSessionMissing()`, `assertStatus()`, `assertSuccessful()`, `assertViewHas()`, `assertViewHasAll()`, `assertViewIs()` and `assertViewMissing()`. You can work with these methods based on the response returned from the json, get, post, put, and delete test methods. The syntax for using the methods are provided on official documentation page.

In addition to the assertion methods, Laravel also provides authentication related assertion methods such as `assertAuthenticated()`, `assertGuest()`, `assertAuthenticatedAs()`, `assertCredentials()` and `assertInvalidCredentials()`.

Browser testing

You can easily perform browser testing with the help of the Laravel Dusk Application Programming Interface (API). To work with Dusk, it is not
