

with the specific selector. Moreover, the `text()` and `attribute()` methods can be used to fetch the display text of an element and attribute of an element respectively. Laravel provides various ways to interact with forms, files, keyboard and mouse, including a wide range of assertions methods specific to Dusk.

Third-party test integration

To run Dusk tests effectively, you can work with CircleCI, and Codeship by making use of the relevant configuration file provided on the official documentation. The `php artisan serve` command should be used to launch the integrated PHP server. The Heroku CI can also be used to run Duck tests by adding the provided Google Chrome buildpack and scripts directly inside your Heroku `app.json` file. If you would like to run Duck tests on top of the Travis CI, you need to use the “sudo-enabled” Ubuntu 14.04 (Trusty) environment. You should note that the Travis CI is not a GUI and hence you need to perform additional steps to launch a Chrome browser before executing the `php artisan serve` command from the terminal.

Database testing

With Laravel, you can employ a wide range of tools that are exclusively created to simplify the complex process involved with testing of database-aware applications. The `assertDatabaseHas()` method can be used to verify whether the data exists in the database that matches the query statement or a specific criteria. The `assertDatabaseMissing()` method

Simplify testing process with Circleci
