

Popular Packages

Here's a look at some of the Laravel specific packages that are a must-know for you.

Think of “package” in IT lingo as help in organising the numerous related components of classes and interfaces that are needed to develop a fully functional website. A package will help with grouping codes needed to develop various components. This aides in faster turnaround of deployment time. With these pre-written packages of codes, web developers can save time and effort through the course of building their website.

Packages in Laravel can broadly be categorised into two types. One type is where the codes in the package are framework (or the standard solution
