

cation which is known to provide comprehensive facilities to programmers working on software development. An IDE is usually comprised of a source code editor, a debugger as well as build automation tools.

While this package does not help in extending Laravel, it is extremely useful when you want to develop Laravel Applications using IDE. For instance, PhpStorm. These IDE's do not type-hint Laravel facades. This package generates a file that your IDE can understand, so it can provide auto-completion. It generates a file based on the files in your project, so it is always up-to-date.

Eloquent Sluggable

There are strings and then there are slugs. And slugs are what you need if you want your web application to be SEO friendly. Simply put, a slug is the URL friendly version of a string. While a string will include everything from letters in different cases to characters like accented letters or ampersands, a slug will involve converting these into URL friendly characters. It will also replace any and all spaces with hyphens. By using Eloquent Sluggable, you can easily create slugs for your models in Laravel.

Laravel Backup

As the name suggests, Laravel Backup is responsible for creating a backup of all of the files in your web application. It does so by creating a zip file which will contain all the files in the directories chosen by your specification as well as a dump of your entire database. It is possible to store this backup on any of the file systems. Doing so is as easy as running the following command -

```
php artisan backup:run
```

With over thousands of packages that are compatible, regardless of whether they are Laravel specific or stand alone, Laravel is definitely moving in the right direction. With every package aiming at making the developer as well as the user's lives simpler, it should come as no surprise that Laravel has managed to take out their competition in less than 7 years. With new upgrades coming in a timely fashion, it's going to be amazing to see what the future has in store for Laravel and web application developers. **d**
