

Property Inspector is where most of the design operations take place.

Going down again brings the resize, position and rotation tools with their respective input fields.

Then comes the large Appearance section. It kicks off with a simple Opacity slider. Then, if you've used the Rectangle to create an object, there would be an option available to define the roundness of the corners. The first option sets one value for all the corners and the second option gives the freedom to have different values for each corner. Next in line is the Fill option, a checkbox to toggle fill visibility, a colour selection popup that also has options for gradients in the dropdown list on top.
