

And outside the popup on the right is a colour picker tool. The Border option that proceeds also has similar settings, but for the stroke of the object. A numerical text field allows weight manipulation of the stroke. And then three options for alignment of the stroke to the path - Inner Stroke, Outer Stroke and Center Stroke. Shadow section also has a toggle and a colour selector popup. The additional options available here are X and Y position of the shadow and its blur value, as denoted by B. Finally, at the end is the blur option which is split into two parts. Background Blur blurs all the objects beneath the current one while giving options to change the blur Amount, Brightness and Opacity. Object Blur simply applies the blur effect on the selected object giving an Amount slider to change blur value.

The inspector also changes when an artboard is selected instead of an object. Most options from the top become unavailable. The first option you get is to change the size and position of the artboard. Next to those are orientation options between Portrait and Landscape.

Going a step down is the Scrolling section. The first option here is a dropdown list that lets you choose between None and Vertical scroll. If you enable Vertical scroll, you're greeted with an option to decide Viewport Height. This is the maximum height of content that would be displayed at a time on the screen before the scroll kicks in.

The Appearance section returns, but this time only with the Fill setting.

And at the end is the Grid section. This allows you to create an overlay grid to act as guides while you place objects on the artboard. First up is a checkbox toggle for grid visibility. Just left of that is a dropdown list for the type of grid - Layout and Square. Square is the default setting and the only customisation option you get are the colour and Square Size, which is the size of each square cell. Layout opens up a slightly different set of more elaborate options. The option to choose colour is there, but instead of Square Size, you have the number of Columns just right of the colour option. Below them are the Gutter Width and Column Width parameter options. Following those are the margin options with a choice between Linked left/right margins and Different margins for each side. The first version uses the same value for all sides and the second one allows you to provide values for each side separately.

Apart from selection tool, the only other tool that uses the inspector is Artboard. When the tool is in use, the inspector produces a list of predefined resolutions for various platforms.
