

anchor point. You should click again when you arrive at a position where the segment should end.

You can also use the Shift + Click keyboard combination to draw the shape at multiples of 45-degrees. If you continue to set anchor points, you can draw more straight segments. As you add more anchor points, the previously formed points will become hollow and deselected. To release the pen tool, you have to press Esc and you can continue to work with other tools. You can close the path by positioning the Pen tool over the first anchor point. It is possible to select and drag the start point without closing the path by holding the Ctrl/Cmd key.

Curves

It is possible to create a curve by adding an anchor point where a curve changes direction. After that, you can drag the direction lines that shape the curve. The shape of the curve will be determined by the length and slope of the direction lines. Adobe recommends you to use limited anchor points to avoid unwanted bumps in a curve. Moreover, the points should be widely spaced by adjusting the length and angles of the direction lines.

Create infinite lines by interconnecting anchor points

After selecting the Pen tool, you can create a C-shaped curve by dragging in a direction opposite to the previous direction line. The S-shaped curve can be created by dragging in the same direction. If you continue dragging the Pen tool from various locations, you can create a series of smooth curves. Moreover, if you hold down the Shift key while dragging, the curves will be in the multiples of 15 degrees.
