

You can draw straight lines followed by curves by using the Pen tool. After clicking corner points in two locations to create a straight segment, position the tool over the selected endpoint. Select the anchor point and drag the direction line that appears on the screen. You need to position the pen where you want the next anchor point to appear and click the new point to finish the curve.

To draw curves by straight lines, you should create the first smooth point of the curved segment using the Pen tool, reposition where you want to end and drag to complete the curve. After positioning the Pen tool over the selected endpoint, you need to reposition the Pen tool where you want the straight segment to end. If you click on this position, you will be able to complete the straight segment.

If you're working with curves using the Pen tool, you should press the Esc key to switch to the drawing mode. You can also double click on the path to edit the curve. If you select the Pen tool, the relevant start and end points will be displayed on the screen. You can continue to extend the path using the displayed points. If you extend a closed path, Adobe XD will reopen the path and invoke the Pen tool in drawing mode.

You can also draw shapes by using the relevant keyboard shortcuts. For example, if you press R, you can draw rectangle without touching the toolbar. Please refer to the Keyboard Shortcuts chapter for a detailed overview of all the available shortcuts.

Text

To work with text-based content, you should select the Text (T) tool and draw the shape of your desired size. You can start typing content inside the box and also modify the font name, size and other formatting parameters. After finishing the content, press the Esc button. If you would like to continue, you can do so by pressing Enter (Windows) or return (Mac) key.

The canvas automatically wraps to the next new line upon typing the content inside the Text tool. It is also possible to type text over other objects. The text tool can be expanded to the desired size as per your requirements. You can adjust the alignment of the text tool by using the options available on the top side of the Property Inspector. You can also select specific individual words or characters in a large chunk of text and modify the font-related parameters.

Adobe XD also provides an option to modify character and line spacing from the Properties dialog box. You just need to type in the content and
