

group of elements to a repeating element. You just need to pull the element and the grid repeats on the design area. If you modify the image dimensions in one element, all images placed inside the grid will be resized. If you are using this feature with Text element, Adobe XD not only repeats the style but also the content. You just need to add additional content in the remaining grids by deleting the original. As a designer, you can save considerable amount of time by effectively using the Repeat Grid feature.

To create a Repeat Grid, you need to design the base element that you would like to repeat by dragging the tool from the Toolbar and by adding the relevant content. For the purpose of our discussion, we will use the Text tool. Select the text tool by clicking on the toolbar and supply the required

Dynamically create repeated grids easily

content. Select the tool and you will view selection pointers on all sides of the text element. Select Ctrl + R keyboard combination and you will view green handles on the right and bottom middle side of the element. You just need to drag the green handle to the bottom side and the grid will be repeated. If you would like to repeat the grid to the horizontal side, you need to drag the green handle to the right side.

The content can be edited by double clicking on the relevant tools. If you drag horizontally further, the grid will be repeated. You can edit the content inside the grid by double clicking on the Text tool. To ungroup the elements, you should select the grid and click Ungroup Grid button in the Property Inspector. As you can see, Adobe XD provides a simplified approach to repeat the grids and the above steps are applicable for all the tools. Please
